

## Household Hazards

Name \_\_\_\_\_ Period \_\_\_\_\_ Date \_\_\_\_\_

**Directions:** Research the commonly found household substances listed below using your phone or PC using valid sources from the web. Describe their use, the active chemical (main chemical that is used in the substance). Then find the chemical formula for that active ingredient. Finally, look to see if there are any health risks associated with their use.

Household Chemical	Household Uses	Active Chemical	Chemical Formula	Health Risks and Hazards
1 Epsom Salt	Laxative, Bathing Agent for sore muscles	Magnesium Sulfate	MgSO <sub>4</sub>	Hypermagnesemia: increased level magnesium in the blood. Symptoms include weakness, confusion, decreased breathing rate, and cardiac arrest.
2 Drain Cleaner				
3 Chewable Antacid				
4 Vinegar				
5 Glass Cleaner				
6				

Table Salt				
7 Shampoo / Body Wash				
8 Baking Soda				
9 Hydrogen Peroxide 2%				
10 Fingernail Polish Remover				
11 Clorox Liquid Bleach				

12 Weed Killer				
13 Antiperspirant				
14 Aspirin				
15 Mosquito Repellant				

**Assessment Questions:**

1. What compounds above are used in the kitchen for cooking. Do any pose a health risk if over consumed?
2. What chemicals above are used in cleaning and what are their associated health risks?
3. List three other commonly used chemicals at home that you may think are dangerous. Research them and see what health risks are associated with them.
4. Magnesium sulfate heptahydrate is the active component in \_\_\_\_\_ What is a hydrate and what are some other common hydrates used in everyday life? Do they pose any risk to your health?
5. When reading the ingredients of household compounds what significance is the order in which they are listed?

6. The detergent used in shampoo is \_\_\_\_\_ is there a potential health risk associated with washing your hair?

7. What health problem may be associated with the chemical aluminum zirconium tetrachlorohydrex-gly is there a household product that a person would use that has this active ingredient?

8. Which substance in the chart above is the most dangerous?

9. What occurs if ammonia and bleach are mixed? Would it be a good idea to mix cleaning chemicals why or why not?

10. Are any of the substances in the chart above also have any medicinal value (used as a medicine)?

## **Honors Chemistry Project – Chemical Reactions Analogies**

We have learned about the five different chemical reactions:

- Synthesis
- Decomposition
- Single Replacement
- Double Replacement
- Combustion (complete and incomplete)

Can you make these understandable to someone who has no or a limited chemistry background? Let's pretend that the audience is a class of middle schoolers. Using only materials that you have at home, what physical items can use to depict the following:

- A synthesis reaction
- A decomposition reaction
- A single replacement reaction (including that some occur and others do not)
- A double replacement reaction

You may choose to include combustion but it is not necessary.

Note: Please use items that you have at home. Try to be as creative as possible. You may not use stock images from the internet. The goal is to create something completely new.

### **The Final Product:**

- Video
- Google Slides
- Something else that I have not thought of. You must request approval no later than 5 pm on Friday, March 20.

### **Assessment:**

Each reaction will be worth 10 points. The 10 points will be based on accuracy of the analogy, clarity, neatness, and spelling. Remember – this could potentially be used by a middle school teacher to help their students understand the concepts. I know that you can make something amazing.

## Significant Figures & Rounding # 1

                 Score

                 Name(print)

### ENGLISH TO METRIC EQUIVALENTS

Length:	1 m = 1.094 yd	2.54 cm = 1 in
Volume:	1 L = 1.06 qt	1 ft <sup>3</sup> = 28.3 L
Mass:	1 kg = 2.205 lb	453.6 g = 1 lb

### Other Useful Equivalents

1 lb = 16 oz	12 in = 1 ft	3 ft = 1 yd	2 pt = 1 qt
60 sec = 1 min	60 min = 1 hr	24 hr = 1 day	4 qt = 1 gal
1 oz = 28.3 g	365.24 day = 1 yr	1 cm <sup>3</sup> = 1 mL	
1 in = 2.54 cm	1 mi = 1760 yd		

1. How many significant figures are in each of the following?

- A. 456126
- B. 5.03
- C. 0.009994
- D. 8.6050
- E. 10.0254

2. Round the following to 3 significant figures.

- A. 4.56789
- B. 8.6423
- C. 5.5555
- D. 6.6499
- E. 0.097652

## Problem Solving Skills #2

Score \_\_\_\_\_

Name(please print) \_\_\_\_\_

For each of the following, determine the appropriate conversion factor. (10 points each)

1. Hours to minutes

2. Days to hours

3. Minutes to seconds

4. Years to days

5. Centuries to years

6. Minutes to hours

7. Hours to seconds

8. Hours to days

9. Years to decades

10. Days to fortnights

## Problem Solving Skills #4

\_\_\_\_\_ Score

Name(print)

For each of the following, determine the result of the conversion using the equalities in the table to the right. (10 points each)

1. 2 miles to kilometers

Equalities
1 mile = 5280 feet
1 foot = 12 inches
1 yard = 3 feet
1 fathom = 2 yards
1 inch = 2.54 centimeters
1 furlong = 220 yards
1 meter = 100 centimeters
1 kilometer = 1000 meters

2. 19 kilometers to furlongs

3. 3.5 meters to inches

4. 90 yards to centimeters

5. 100 fathoms to meters

6. 52 feet to furlongs

7. 3 miles to fathoms

8. 982 meters to yards

9. 1 mile to centimeters

10. 854 furlongs to kilometers

## Problem Solving Skills Setup #1

Score \_\_\_\_\_

Name(print) \_\_\_\_\_

Solve the following **using the equalities in the table**. Show setup only (10 points each unless otherwise noted)

1. Convert 9.45 quarts to pints.

Equivalents
2 pt = 1 qt
4 qt = 1 gal
1.06 qt = 1 L
$10^{-3}$ L = mL
$10^{-6}$ L = $\mu$ L

2. Convert  $7.11 \times 10^4$  microliters to liters.

3. Convert 9.27 quarts to liters.

4. Convert 2011 quarts to gallons.

5. Convert 55.4 liters to milliliters

6. Convert  $1.25 \times 10^5$  gallons to pints (20 points)

7. Convert  $1.84 \times 10^{12}$  microliters to pints. (30 points)

## Problem Solving Skills #5

\_\_\_\_\_ Score

\_\_\_\_\_ Name (print)

For each of the following, determine the appropriate conversion factor using the equalities in the table to the right. (20 points each)

1. 21 dynes to cogs

Equalities
2 ergs = 5 gits
3 gits = 4 cogs
1 cog = 17 sprockets
5 cogs = 7 dynes

2. 28 cogs to gits

3. 95 gits to ergs

4. 3 cogs to sprockets

5. 10 ergs to gits

#### Your Exit Ticket Practice - To Be Handed in Before You Leave Today!

Directions: Convert the following word equation into a formula equation:

**Exit Ticket**

Name: Ken Date: \_\_\_\_\_ Class period: \_\_\_\_\_

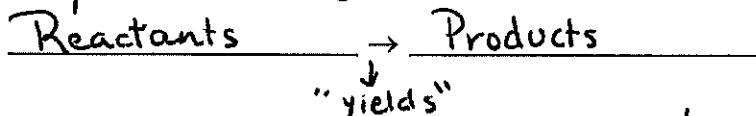

After today, you should be able to:

- Identify and write formulas for the diatomic elements
- Write a formula equation given the word equation for a chemical reaction

## Unit: Chemical Reactions

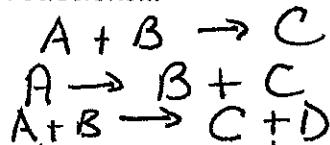

### Day 1 Notes - Writing Formula Equations from Word Equations

A chemical equation represents a chemical reaction

Reactants and products are separated from each other with a plus (+) sign.

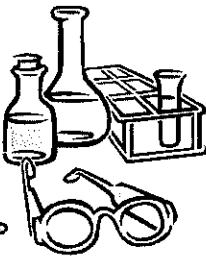

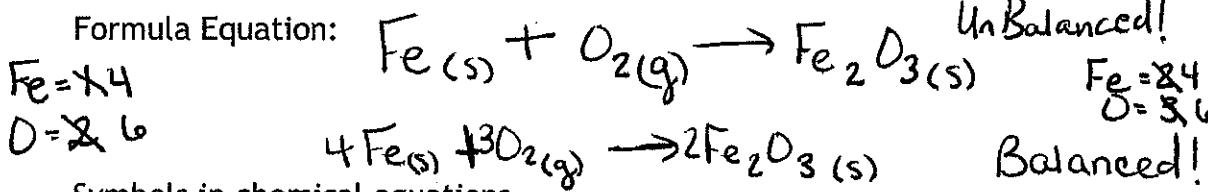

Common forms of chemical reactions...

Chemical equations can be written as word equations or formula equations

Formula equations can be balanced or unbalanced

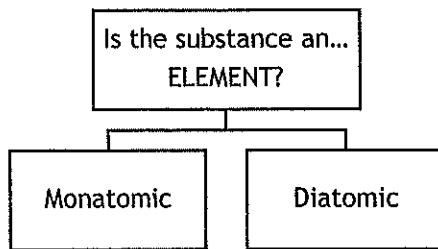

Word Equation: Iron + oxygen  $\rightarrow$  Iron (III) Oxide

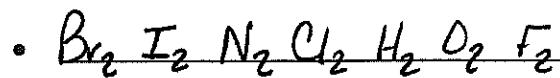

Symbols in chemical equations

Symbol	Meaning
(s)	Solid
(l)	liquid
(g)	gas
(aq)	aqueous (dissolved in water)
$\leftrightarrow$	equilibrium (can go either way)
$\xrightarrow{\Delta \text{ or heat}}$	catalyst (such as heat)
$\rightarrow$	yields

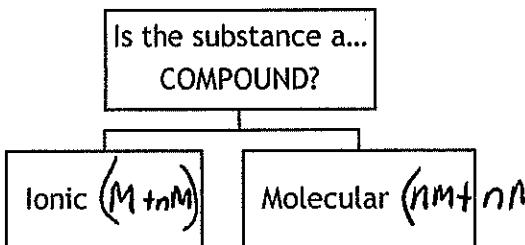

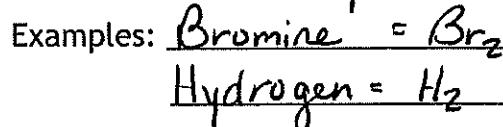

To change word equations into formula equations follow the flow chart...

- Just write the symbol  
Example: Na = Sodium

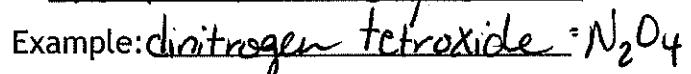

- Have the subscript "2"

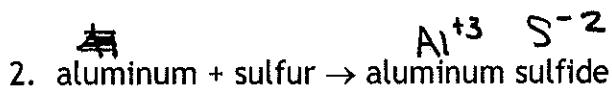

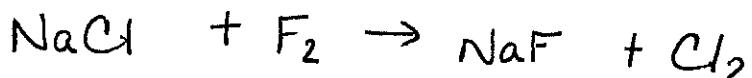

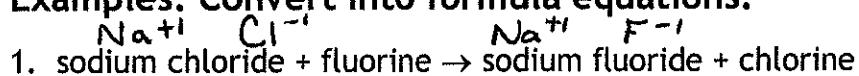

- Balance Charges!

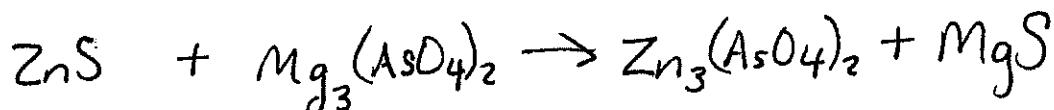

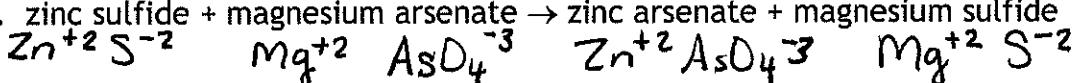

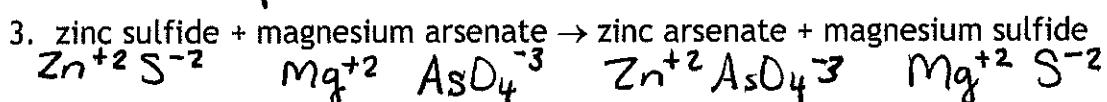

- Prefix for Subscripts

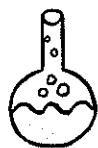

Examples: Convert into formula equations.

Helpful tip: Keep all substances and + signs in line with each other

Name: \_\_\_\_\_ Date: \_\_\_\_\_ Class period: \_\_\_\_\_

## Unit: Chemical Reactions

### “Writing Formula Equations” - WS #1

**Directions:** Convert the following word equations into formula equations by changing element and compound names into chemical formulas.

1. sodium + oxygen → sodium oxide
  
  
  
  
  
  
  
  
2. copper + silver nitrate → copper(II) nitrate + silver
  
  
  
  
  
  
  
  
3. aluminum chloride + barium sulfate → aluminum sulfate + barium chloride
  
  
  
  
  
  
  
  
4. bromine + calcium iodide → calcium bromide + iodine
  
  
  
  
  
  
  
  
5. zinc sulfide + magnesium arsenate → zinc arsenate + magnesium sulfide
  
  
  
  
  
  
  
  
6. cobalt + lead(II) nitrite → cobalt(III) nitrite + lead
  
  
  
  
  
  
  
  
7. potassium + water → potassium hydroxide + hydrogen

Name: \_\_\_\_\_ Date: \_\_\_\_\_ Class period: \_\_\_\_\_

### Unit: Chemical Reactions

#### Bellwork, Day 2: "Word Equations into Formula Equations"

Directions: Please convert the following word equations into formula equations.

**Exit Ticket**

Name: \_\_\_\_\_ Date: \_\_\_\_\_ Period: \_\_\_\_\_

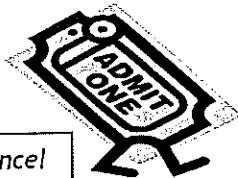

#### Your Exit Ticket Practice - To Be Handed in Before You Leave Today!

Directions: Balance the following equation.

H<sub>3</sub>PO<sub>4</sub> doesn't need ( )

Hint: Cross-out H<sub>2</sub>O and write H(OH) above it. This will make it much easier to balance!

Name: Key Date: \_\_\_\_\_ Class period: \_\_\_\_\_

After today, you should be able to:

- Explain the Law of Conservation of Atoms
- Balance equations using the "tally method"

## Unit: Chemical Reactions

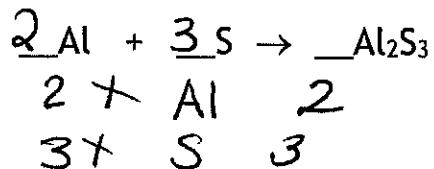

Day 2 Notes - Balancing Equations

Law of Conservation of Atoms: There must be the same number of each type of atom before the reaction as after the reaction

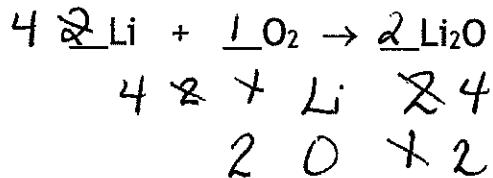

Coefficients: Numbers that go in front of each substance to indicate the number of atoms or molecules that are reacting or being produced.

Examples:

Balance using  
"tally" method.

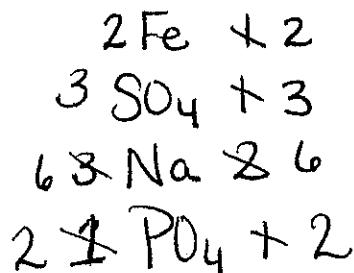

If #s on either side of  $\rightarrow$  equal,  
then you are balanced.

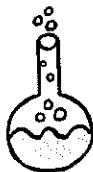

Helpful Hint!

Do not separate  
polyatomic ions!

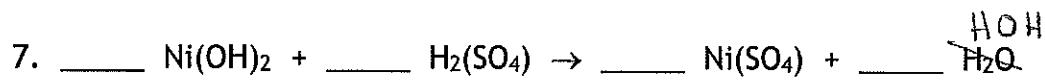

Name: \_\_\_\_\_ Date: \_\_\_\_\_ Class period: \_\_\_\_\_

## Unit: Chemical Reactions “Balancing Equations” - WS #2

**Directions:** Balance the following equations:

Name: \_\_\_\_\_ Date: \_\_\_\_\_ Class period: \_\_\_\_\_

**Unit: Chemical Reactions**  
**Bellwork, Day 3: "Balancing Equations"**

**Directions:** Please balance the following equations.

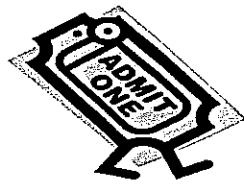

**Exit Ticket**

Name: \_\_\_\_\_ Date: \_\_\_\_\_ Period: \_\_\_\_\_

**Your Exit Ticket Practice - To Be Handed in Before You Leave Today!**

**Directions:** Convert the following word equation into a balanced formula equation.

Name: \_\_\_\_\_ Date: \_\_\_\_\_ Class period: \_\_\_\_\_

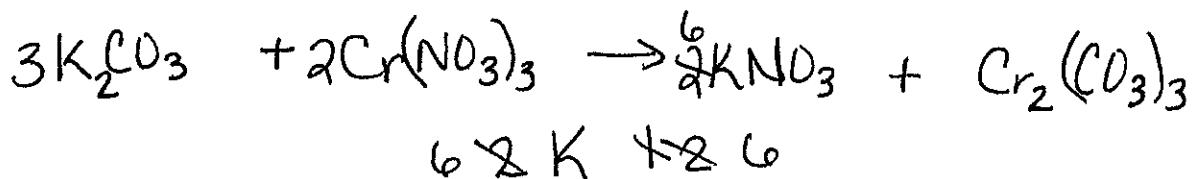

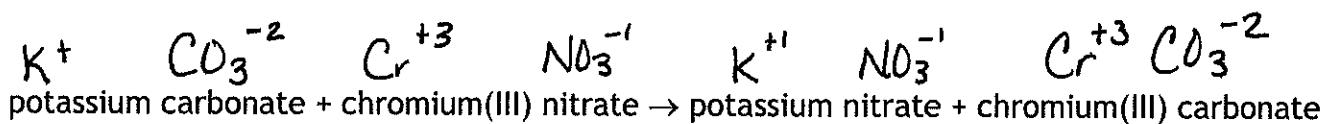

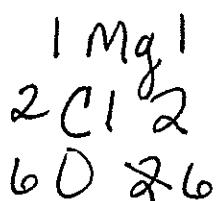

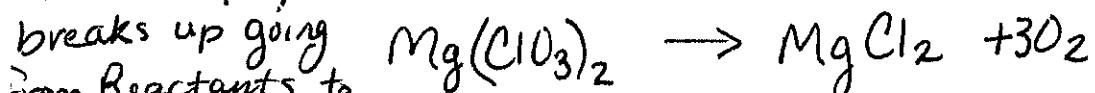

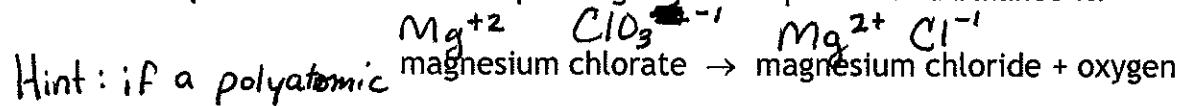

After today, you should be able to:

- Write balanced formula equations from word equations

## Unit: Chemical Reactions

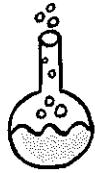

### Day 3 Notes - Writing Formula Equations and Balancing

Examples: Write the corresponding formula equation and balance it.

Hint: If polyatomic keeps the same appearance from Reactants to products, keep it together to balance

Name: \_\_\_\_\_ Date: \_\_\_\_\_ Class period: \_\_\_\_\_

## Unit: Chemical Reactions “Putting it Together” - WS #3

*Directions:* Convert the following word equations into formula equations then balance them.

6. copper(I) phosphate + nickel → nickel (II) phosphate + copper

7. sodium iodide + magnesium chlorate → magnesium iodide + sodium chlorate

8. iron(III) chromate + lithium nitrate → iron(III) nitrate + lithium chromate

9. aluminum chlorate → aluminum chloride + oxygen

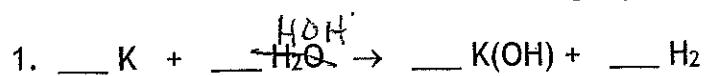

10. barium + water → barium hydroxide + hydrogen

Name: \_\_\_\_\_ Date: \_\_\_\_\_ Class period: \_\_\_\_\_

**Unit: Chemical Reactions**

**Bellwork, Day 4: "Problem areas to watch out for..."**

*Directions:* Please balance the following equation.

*Directions:* Please convert the word equation into the formula equation, and balance the equation.

1. aluminum hydroxide + iron (II) chloride  $\rightarrow$  iron (II) hydroxide + aluminum chloride

Name: \_\_\_\_\_

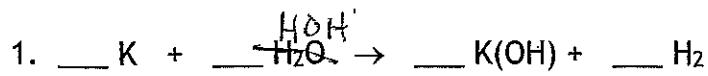

Date: \_\_\_\_\_

Class period: \_\_\_\_\_

**Unit: Chemical Reactions**

**Bellwork, Day 4: "Problem areas to watch out for..."**

**Directions:** Please balance the following equation.

**Directions:** Please convert the word equation into the formula equation, and balance the equation.

1. aluminum hydroxide + iron (II) chloride  $\rightarrow$  iron (II) hydroxide + aluminum chloride

Name: \_\_\_\_\_ Date: \_\_\_\_\_ Class period: \_\_\_\_\_

After today, you should be able to:

- Identify synthesis and decomposition reactions
- Use patterns to predict the products of synthesis and decomposition reactions

## Unit: Chemical Reactions

### Day 4 Notes - Types of Reactions: Synthesis and Decomposition

- 1) Synthesis
- 2) Decomposition
- 3) Single Replacement
- 4) Double Replacement
- 5) Combustion

Predicting Products

1) Synthesis: 2 elements Combine to form a Compound

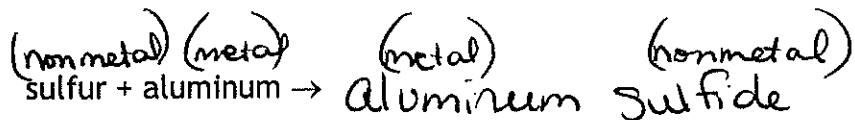

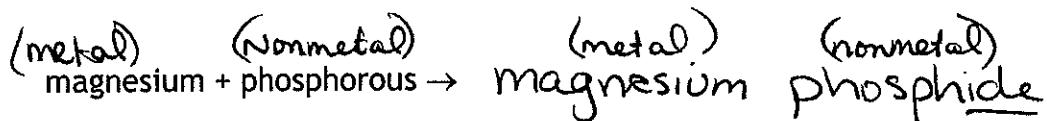

Common form:

Examples of synthesis:

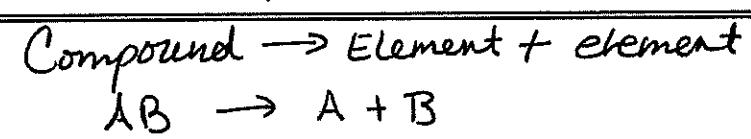

Metals come first in ionic bond names!

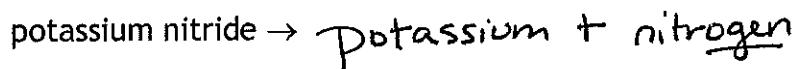

2) Decomposition: A compound breaks down into elements and/or smaller compounds

Common form:

Example of decomposition:

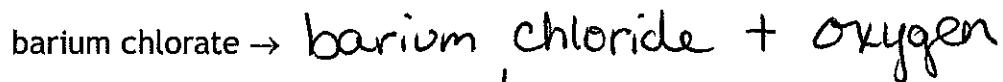

Go back to non-metal's original ending.

## Examples of "Special Decompositions":

Example of a metal chlorate decomposition:

Always part of the product!

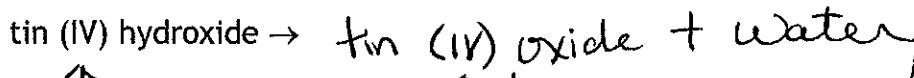

Example of a metal carbonate decomposition:

Always part of the product!

Example of a metal hydroxide decomposition:

↑  
Don't forget the  
Roman numeral!

Always part of the  
product!

Name: \_\_\_\_\_ Date: \_\_\_\_\_ Class period: \_\_\_\_\_

## Unit: Chemical Reactions “Predicting Products - S/D” - WS #4

**Directions:** Predict the products for each of the following reactions in words.

\*Metal 1st!

\*Metal 1st!\*

\* Metal 1st! \*

13. potassium chloride →

14. iron(III) oxide →

15. sodium sulfide →

16. magnesium nitride →

17. calcium chlorate →  
Oxygen is a product

18. strontium hydroxide →  
Water is a product

19. lithium carbonate →  
Carbon dioxide is a product

20. silver fluoride →

21. tin(IV) chlorate →  
Oxygen is a product

22. zinc phosphide →

23. copper(I) hydroxide →  
Water is a product

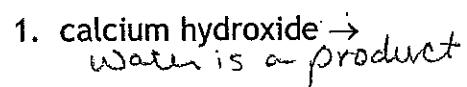

24. nickel (II) bromide →

Name: \_\_\_\_\_ Date: \_\_\_\_\_ Class period: \_\_\_\_\_

**Unit: Chemical Reactions**

**Bellwork, Day 5: "Synthesis and Decomposition Reactions"**

**Directions:** Please predict the products in words for the following word equations.

metal 1st! to

Name: Key, Date: \_\_\_\_\_ Class period: \_\_\_\_\_

After today, you should be able to:

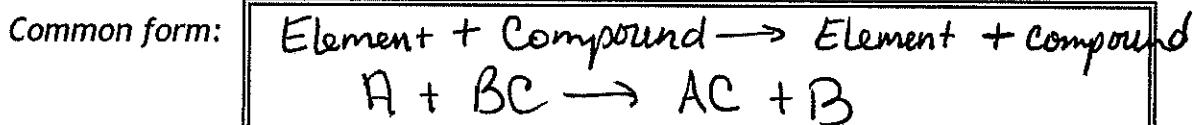

- Identify single replacement reactions
- Use patterns to predict products of single replacement reactions
- Predict whether or not a single replacement reaction will occur

## Unit: Chemical Reactions

### Day 5 Notes - Types of Reactions: Single Replacement

#### Predicting Products

3) Single Replacement: An element and compound react to form a different element and different compound

- These reactions do not always occur in nature (they're impossible)
- You must use the "activity series" sheet
- "Like will replace like" - metals always replace metals, etc.

#### Examples of single replacements:

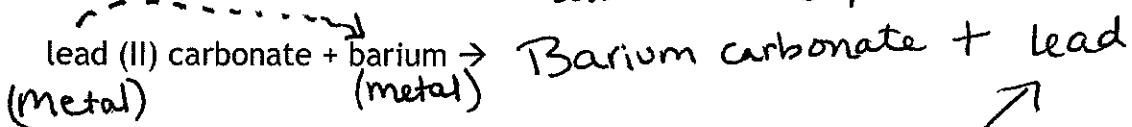

(1) A metal in a compound is replaced by a more active metal

Since lithium is listed <sup>therefore</sup> higher than zinc on "activity series" sheet, the reaction goes forward!

$$\begin{array}{ccc} \text{copper} & + & \text{aluminum sulfate} \\ (\text{metal}) & & (\text{metal}) \end{array} \rightarrow \begin{array}{c} \text{No Reaction!} \\ \text{?} \end{array}$$

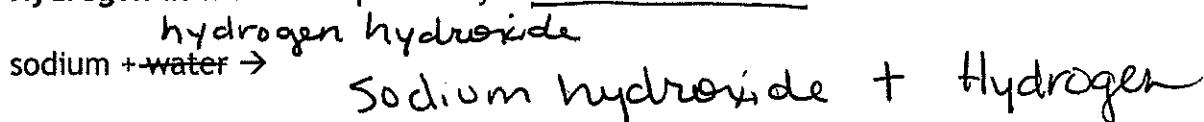

Copper is lower on "activity series" sheet  $\rightarrow$  therefore is less reactive than aluminum. So, No Rxn!

Barium is higher (ie more reactive) than lead, so reaction proceeds.

No Roman numeral necessary when it's by itself.

(2) Hydrogen in water is replaced by a more active metal

1st change  $\text{H}_2\text{O}$  water to hydrogen hydroxide ( $\text{HOH}$ )

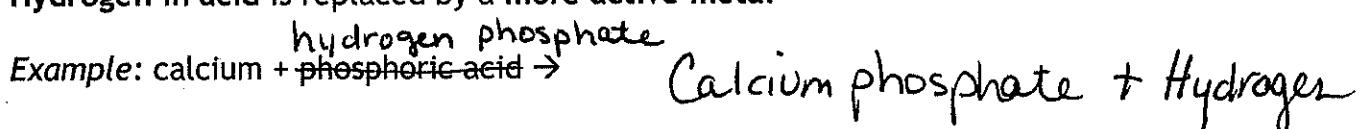

2nd look at activity series.

2nd Look at activity series.  $\text{Mg}$  is "more" reactive than hydrogen b/c it's

3rd Sodium is "more" reactive than  $\text{Mg}$   
listed higher on "activity series" sheet

So, reaction occurs.

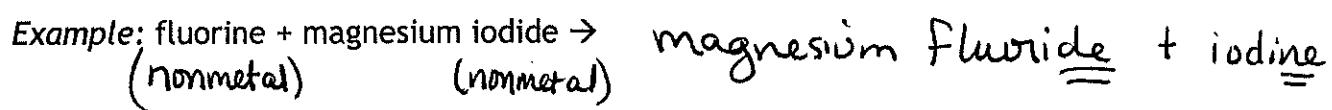

(3) Hydrogen in acid is replaced by a more active metal

Since calcium is more reactive than hydrogen, it will replace hydrogen.

Helpful tip: Change acid name to ionic name.

(4) A nonmetal in a compound is replaced by a more active nonmetal

\* Look at "activity series" for non-metals \*

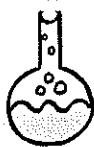

Fluorine is higher than iodine so it's strong enough to replace iodine.

Watch your endings!

Make sure "like Replaces like"

In this example, nonmetal Replaces non-metal.

Name: \_\_\_\_\_ Date: \_\_\_\_\_ Class period: \_\_\_\_\_

## Unit: Chemical Reactions "Predicting Products - SR" - WS #5

*Directions:* Predict the products for each of the following reactions in words.

*don't worry about Roman numerals in product*

*Danger of combustion! Run!*

*Oops!  
Mrs. Lewis  
→ almost  
burst over*

Name: \_\_\_\_\_ Date: \_\_\_\_\_ Class period: \_\_\_\_\_

**Unit: Chemical Reactions**  
***Bellwork, Day 6: "Loaded question... Muahaha!"***

**Directions:** Please answer each of the following questions to the best of your ability.

1. What type of reaction is this?
2. Using the reaction above, write out the word equation:
3. Write the balanced formula equation below:

Name: \_\_\_\_\_ Date: \_\_\_\_\_ Class period: \_\_\_\_\_

After today, you should be able to:

- Identify double replacement and combustion reactions
- Use patterns to predict the products of double replacement and combustion reactions
- Predict the products in words for double replacement reactions
- Predict the products and balance combustion reactions

## Unit: Chemical Reactions

Day 6 Notes - Types of Chemical Reactions: Double Replacement and Combustion

Predicting Products

4) Double Replacement: Two Compounds react to form two new compounds

Common form: Compound + Compound  $\rightarrow$  Compound + Compound  
 $AB + CD \rightarrow AD + CB$

Examples of a double replacement:

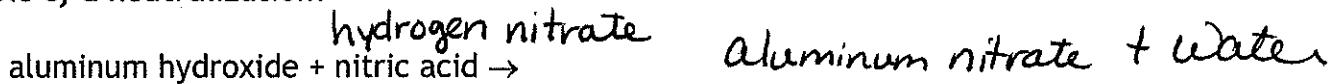

Do not use "activity series" sheet for these!

A neutralization reaction is a type of double replacement reaction.

Neutralization Reaction: A neutralization reaction is a type of double replacement reaction.

between an acid and a base (base-a metal hydroxide ex: NaOH)

Example of a neutralization:

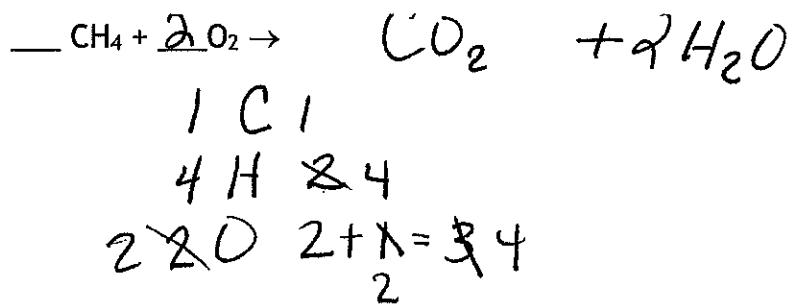

Water will always be a product!

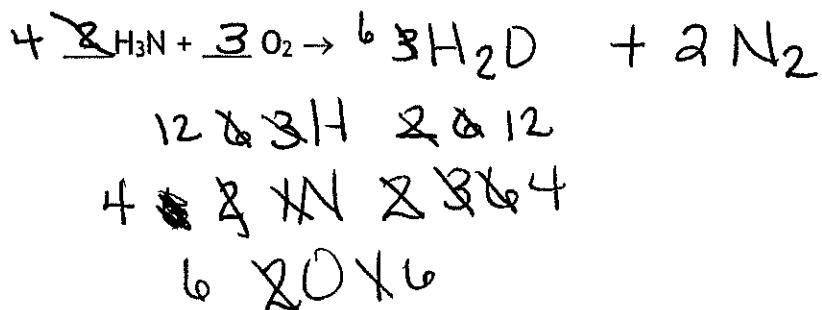

5) Combustion: A reaction with Oxygen ( $O_2$ )

If your reactant contains:	The product will be:
C	$CO_2$
H	$H_2O$
S	$SO_2$
N	$N_2$

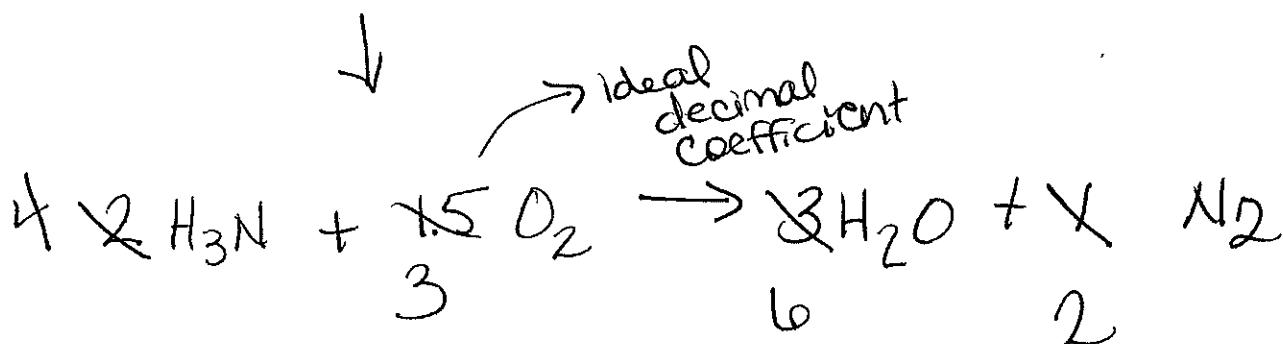

Examples: Predict the products and balance.

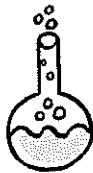

Helpful tip: Balance the  $\text{O}_2$  ~~last!~~

Helpful tip: Put the ideal decimal coefficient, then ~~double~~ all coefficients to balance.

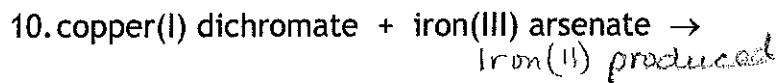

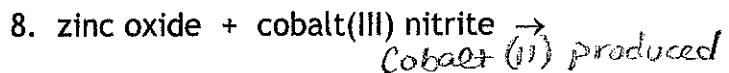

Name: \_\_\_\_\_ Date: \_\_\_\_\_ Class period: \_\_\_\_\_

## Unit: Chemical Reactions “Predicting Products - DR/C” - WS #6

**Directions:** Predict the products in words for the following double replacement reactions:

*Directions:* Write the products for the following reactions then balance!

Name \_\_\_\_\_

**CHEMISTRY 1****FORMULA WRITING**

Chemical substances are described by names and formulas. A chemical formula is a shorthand method for indicating a compound. The formulas for ionic compounds are determined by the charges on the ions. In this activity, you will use cards to represent ions and put them together to make compounds. You will then determine the formula for the ionic compound.

**Procedure:**

1. Obtain two ions sheets (one positive and one negative). Cut out all of the ions discarding all waste in the trash can.
2. Put the ions together to form the compounds below. All compounds should be represented by a rectangle. (Fill all indentations and cover all points.)
3. Glue the ion cards in your notebook. Write the name and formula near each compound.

**NOTE:**

- Positive ions are written first in a formula.
- Subscripts follow the symbol and indicate the number of atoms of each element present.
- One's are understood and not written as subscripts.

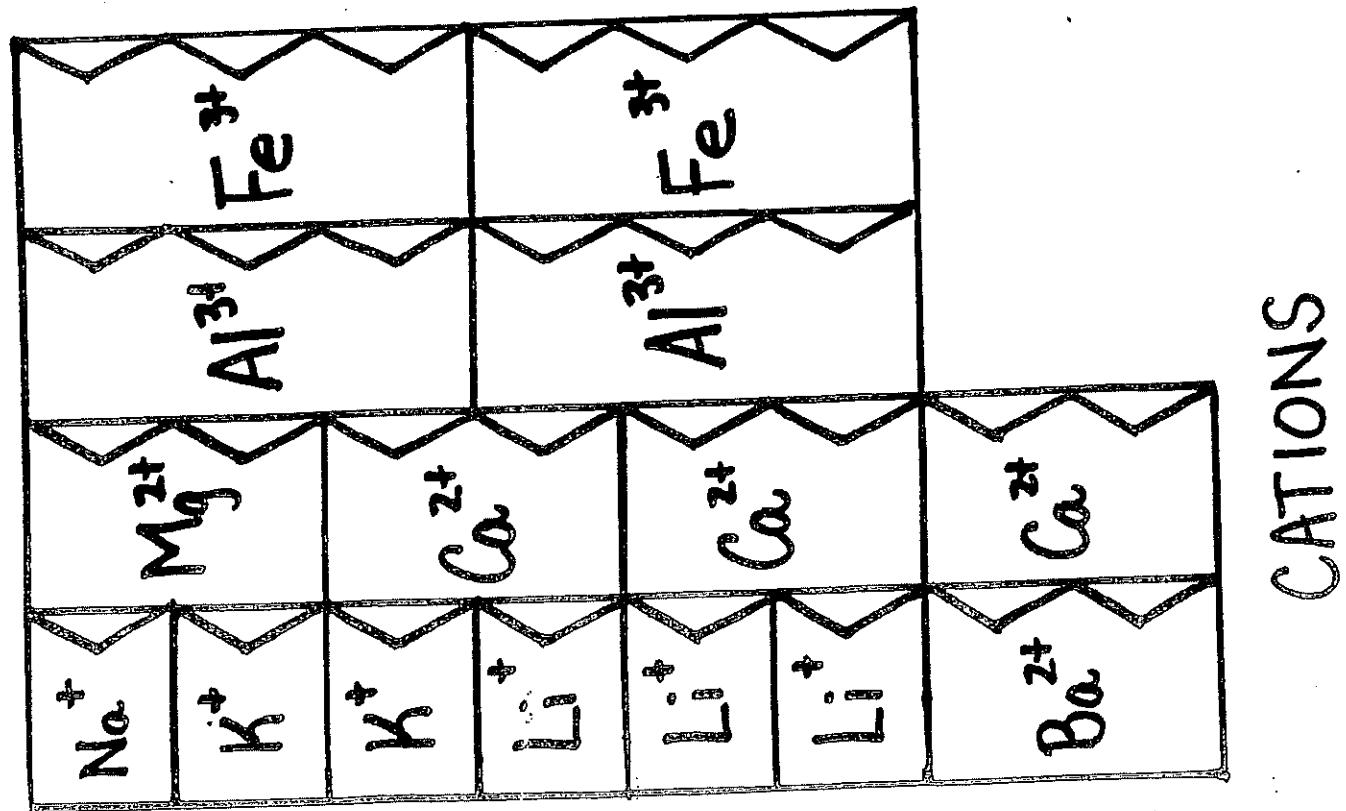

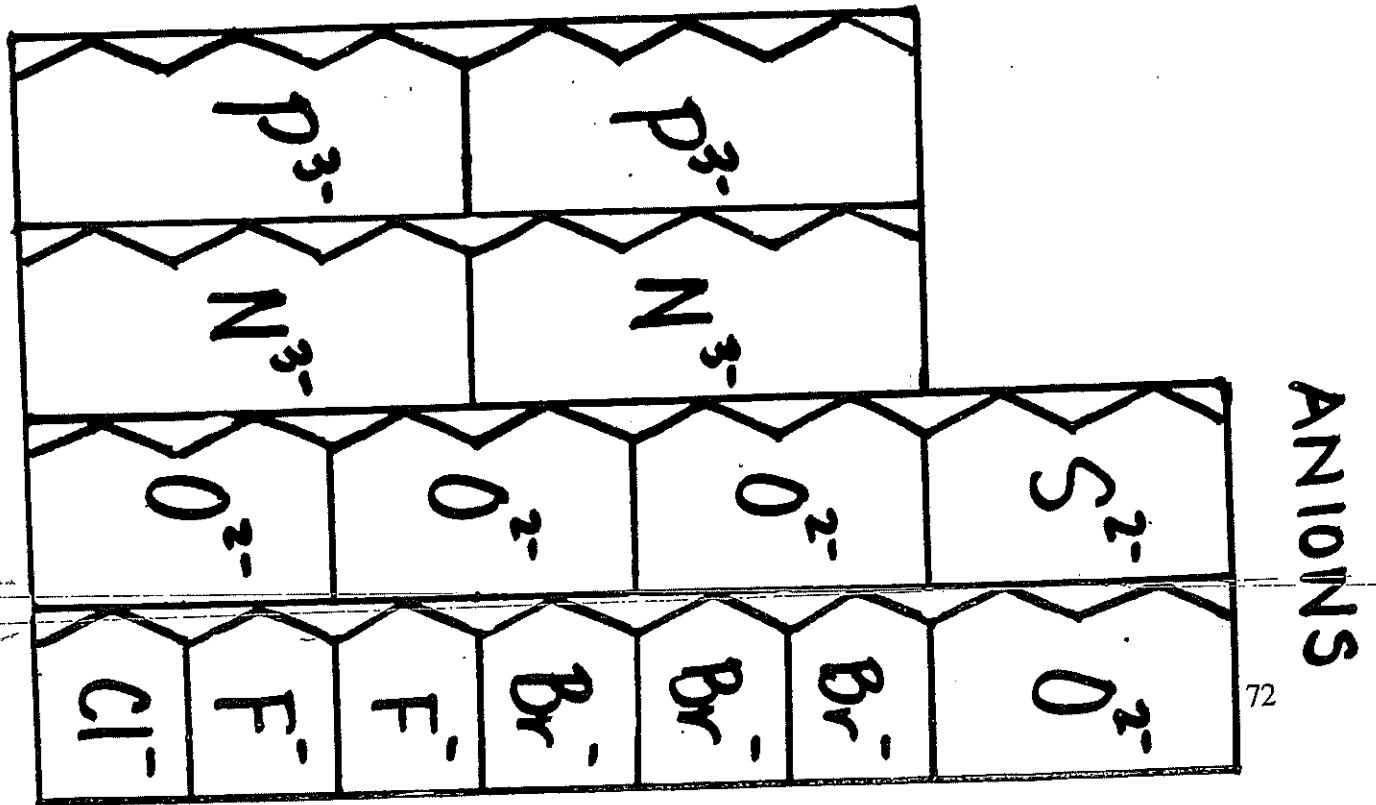

**Results:**

1. sodium chloride
2. barium oxide
3. aluminum nitride
4. potassium sulfide
5. magnesium fluoride
6. lithium nitride
7. aluminum bromide
8. calcium phosphide
9. iron (III) oxide

**Conclusion:**

Describe how you would determine the formula for an ionic compound without using ion cards. Use specific examples in your discussion.

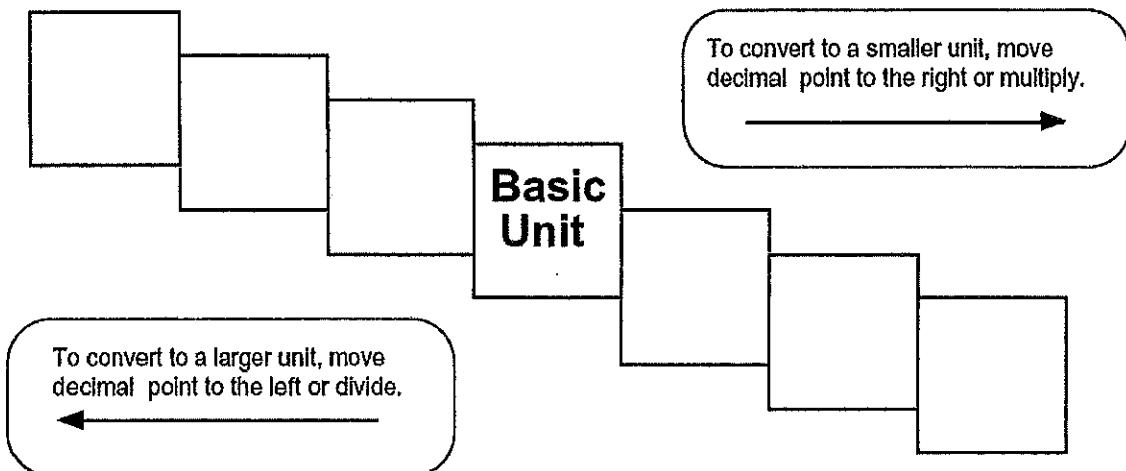

# Metric Mania

Name \_\_\_\_\_

## Metric Conversions

Fill in the boxes in the stair step diagram.

Try these conversions using the ladder method.

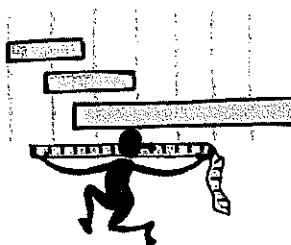

$$1000 \text{ mg} = \underline{\hspace{2cm}} \text{ g} \quad 1 \text{ L} = \underline{\hspace{2cm}} \text{ mL} \quad 160 \text{ cm} = \underline{\hspace{2cm}} \text{ mm}$$

$$14 \text{ km} = \underline{\hspace{2cm}} \text{ m} \quad 109 \text{ g} = \underline{\hspace{2cm}} \text{ kg} \quad 250 \text{ m} = \underline{\hspace{2cm}} \text{ km}$$

Compare using  $<$ ,  $>$ , or  $=$ .

$$56 \text{ cm} \bigcirc 6 \text{ m}$$

$$7 \text{ g} \bigcirc 698 \text{ mg}$$

## Metric Conversion Practice

**Write the correct abbreviation for each metric unit.**

1) Kilogram \_\_\_\_\_

4) Milliliter \_\_\_\_\_

7) Kilometer \_\_\_\_\_

2) Meter \_\_\_\_\_

5) Millimeter \_\_\_\_\_

8) Centimeter \_\_\_\_\_

3) Gram \_\_\_\_\_

6) Liter \_\_\_\_\_

9) Milligram \_\_\_\_\_

**Try these conversions, using the ladder method.**

10)  $2000 \text{ mg} = \underline{\hspace{2cm}}$  g

15)  $5 \text{ L} = \underline{\hspace{2cm}}$  mL

20)  $16 \text{ cm} = \underline{\hspace{2cm}}$  mm

11)  $104 \text{ km} = \underline{\hspace{2cm}}$  m

16)  $198 \text{ g} = \underline{\hspace{2cm}}$  kg

21)  $2500 \text{ m} = \underline{\hspace{2cm}}$  km

12)  $480 \text{ cm} = \underline{\hspace{2cm}}$  m

17)  $75 \text{ mL} = \underline{\hspace{2cm}}$  L

22)  $65 \text{ g} = \underline{\hspace{2cm}}$  mg

13)  $5.6 \text{ kg} = \underline{\hspace{2cm}}$  g

18)  $50 \text{ cm} = \underline{\hspace{2cm}}$  m

23)  $6.3 \text{ cm} = \underline{\hspace{2cm}}$  mm

14)  $8 \text{ mm} = \underline{\hspace{2cm}}$  cm

19)  $5.6 \text{ m} = \underline{\hspace{2cm}}$  cm

24)  $120 \text{ mg} = \underline{\hspace{2cm}}$  g

**Compare using <, >, or =.**

25)  $63 \text{ cm} \bigcirc 6 \text{ m}$

27)  $5 \text{ g} \bigcirc 508 \text{ mg}$

29)  $1,500 \text{ mL} \bigcirc 1.5 \text{ L}$

26)  $536 \text{ cm} \bigcirc 53.6 \text{ dm}$

28)  $43 \text{ mg} \bigcirc 5 \text{ g}$

30)  $3.6 \text{ m} \bigcirc 36 \text{ cm}$

**Challenge:** Create three conversion problems for your classmates along with the correct answers.

Name \_\_\_\_\_

Calculate the molar masses of the following chemicals:
